### 3 PROCESS DESCRIPTION

All runs have been found appropriate, no anomalies happened and all runs below have been validate and found compliant. All load logs have been positioned front to back direction into the firebox. No logs have been debarked, all logs were split to meet individual and total load weight range for the firebox. None of them have been squared. Filters have been weighted in pairs as required by the ALT-134 testing method to reduce weighting error propagation.

#### 3.1 DISCUSSION

During the 1<sup>st</sup> run (cat. 4) the air inlet is maintained fully open to aim for the maximum power of 55 000 Btu/hr. The furnace delivers during the test an average of 53 042 Btu/hr at 5.37 kg/hr burn rate, and reach within 10% the targeted output delivery category of the maximum burn rate. The delivery efficiency at this output category was 52.7 % and emission of 0.133 lb/MMBtu output, 40.0 lbs of fuel have been consumed with 9.07 gr total emission.

During the 2<sup>nd</sup> run the wood furnace was set to a category 1 burn rate at least one hour before beginning the sampling. The combustion air fan is maintained to ON position for a 5 minutes-period following the load insertion and then switch to OFF (minimum burn rate position) for the rest of the test. The furnace delivers during the test an average of 15 997 Btu/hr at 1.164 kg/hr and reaches the targeted output delivery category of the category 1. The delivery efficiency at this output category was 73.0 % and emission of 0.087 lb/MMBtu output, 39.34 lbs of fuel have been consumed with 8.05 gr total emission.

During the 3<sup>rd</sup> run the wood furnace was set to category 3 burn rates at least one hour before beginning the sampling. The furnace delivers during the test an average of 29 737 Btu/hr, and reach the targeted category 3. The delivery efficiency at this output category was 64.8 % and emission of 0.144 lb/MMBtu output, 41.78 lbs of fuel have been consumed with 12.5 gr total emission. During this test the combustion fan have been cycled between on and off to maintain target output delivery within the category 3.

During the 4<sup>th</sup> run the wood furnace was set to category 2 burn rate output at least one hour before beginning the sampling. The combustion air fan is maintained to ON position for a 5 minutes-period following the load insertion and then switch to OFF. The combustion fan was manually open and close during test to aim for the targeted output category 2. The furnace delivers during the test an average of 21 922 Btu/hr output at 1.63 kg/hr burn rate, and reach the targeted output delivery category of the category 2. The delivery efficiency at this output category was 71.5 % and emission of 0.148 lb/MMBtu output, 42.56 lbs of fuel have been consumed with 14.48 gr total emission.

### 3.4 START-UP OPERATION

The complete firing procedure of each burn rate category is fully described in appendix.

## 4 SAMPLING SYSTEMS

### 4.1 SAMPLING LOCATIONS

Particulate samples are collected from the dilution tunnel. The tunnel has two elbows. The sampling section is a continuous section of 8-inch diameter pipe straight over its entire length. Tunnel velocity pressure is determined by a standard pitot tube located upstream from the sampling section. Thermocouple is installed on the Pitot tube to measure the dry bulb temperature MC is assumed, as allowed, to be 2%. Tunnel samplers are located downstream of the Pitot tube and upstream from the end of this section. All details of the dilution tunnel can be found in Appendix 10.

### 4.2 DRAWINGS

Various drawings of the stack gas sampling train and of dilution tunnel system are found in Appendix 9.

### 4.3 EMISSIONS EFFICIENCY TESTING EQUIPMENT LIST

The complete test equipment list together with all corresponding calibration data can be found in Appendix 10.

## 5 SAMPLING METHODS

### 5.1 PARTICULATE SAMPLING

Particulates were sampled in strict accordance with ASTM E2515. This method uses two identical sampling systems with 47mm Teflon-coated glass fiber filters (PALL TX40) are used and weighted in pair. The dryers used in the sample systems are filled with "Drierite" before each test run.

## 6 QUALITY ASSURANCE

### 6.1 INSTRUMENT CALIBRATION

#### 6.1.1 GAS METERS

At the conclusion of each test program the gas meters are verified using the reference dry gas meter. This process involves sampling the train operation for 1 cubic foot of volume. With readings made to .001 fr', the resolution is .1 %, giving an accuracy higher than the 2% required by the standard. All gas Meter are ISO 17025 Calibrated every 6 months.

#### 6.1.2 STACK SAMPLE MASS FLOW CONTROLLER

The stack sample mass flow meter regulates each flow rate used during the test program. The flow rate is acquisitioning every minute during the test run and use for the proportionality calculation. The dry gas meter volume measured is then corrected to standard temperature and pressure conditions.

#### 6.1.3 GAS ANALYZERS

The continuous analyzers are zeroed and spanned before each test with NIST traceable gases. A mid-scale multi-component calibration gas is then analyzed (values are recorded). At the conclusion of a test, the instruments are checked again with zero, span and calibration gases (values are recorded only). The drift in each meter is then calculated and must not exceed 5% of the scale used for the test.

At the conclusion of each unit test program, a three-point calibration check is made and must meet accuracy requirements of the applicable standards. Consistent deviations between analyzer readings and calibration gas concentrations are used to correct data before computer processing.

## 6.2 TEST METHOD PROCEDURES

### 6.2.1 LEAK CHECK PROCEDURES

Before and after each test, each sample train is tested for leaks. Leakage rates are measured and must not exceed 0.02 CFM or 4% of the sampling rate. Leak checks are performed checking the entire sampling train. Pre-test and post-test leak checks are conducted with a vacuum of 5 inches of mercury. Vacuum is monitored during each test and the highest vacuum reached is then used for the post-test vacuum value. If leakage limits are not met, the test run is rejected. During these tests, the vacuum is typically less than 2 inches of mercury. Thus, leakage rates reported are expected to be much higher than actual leakage during the tests.

### 6.2.2 TUNNEL VELOCITY FLOW MEASUREMENT

The tunnel velocity is calculated from a center point pitot tube signal multiplied by an adjustment factor. This factor is determined by a traverse of the tunnel as prescribed in EPA Method 1. Final tunnel velocities and flow rates are calculated from EPA Method 2, Equation 6.9 and 6.10. (Tunnel cross sectional area is the average from both lines of traverse.)

Pitot tubes are cleaned before each test and leak checks are conducted after each test.

### 6.2.3 PM SAMPLING PROPORTIONALITY (ASTME2515)

Proportionality was calculated in accordance with ASTM E2515. The data and results are in appendix.

### 6.2.4 HEAT OUTPUT MEASUREMENT

Output measurement is done with Thermocouple grid in the outlet duct and Pitot Type S for flow measurement of duct air outlet. Data Acquisition system log every minute for output calculation. Before the ignition of the test a pitot factor is measured and calculated with a vane Anemometer.

$\Delta_p$  = manometer reading (inches H<sub>2</sub>O)

$T_s$  = average absolute dilution tunnel temperature (°F + 460)

Where,

 $C_p$  = pitot tube coefficient, dimension less = 0.99 for standard pitot.

 $\Delta_p$  = manometer reading (inches H<sub>2</sub>O)

 $T_s$  = average absolute dilution tunnel temperature (°F + 460)

 $P_s$  = absolute dilution tunnel gas pressure or  $P_{bar} + P_{qg}$ 
 $P_q$  = static pressure in. H<sub>2</sub>O

 $M_s$  = 28.56, wet molecular weight of stack gas (alternatively, it may be measured)

 $K_p$  = 85.49 pitot tube constant, (conversion factor for English units)

 $\Delta_p$  avg. = average of the square roots of the velocity heads ( $\Delta_p$ ) measured at each traverse point.

For improved legibility of the graphics only increasing measurement points are shown and measurement points close to zero are not displayed.

The uncertainty stated is the expanded uncertainty at calibration obtained by multiplying the standard combined uncertainty by the coverage factor k – which can be larger than 2 according to EURAMET cg-18. The value of the measurand lies within the assigned range of values with a probability of approximately 95%.

The user is responsible for maintaining environmental conditions and the settings of the weighing instrument when it was calibrated.

**Measurement Uncertainty of the Weighing Instrument in Use**

Stated is the expanded uncertainty with k=2 in use. The formula shall be used for the estimation of the uncertainty under consideration of the errors of indication. The value R represents the net load indication in the unit of measure of the device.

Temperature coefficient for the evaluation of the measurement uncertainty in use: 3.0 · 10<sup>-6</sup> / K

### UNCERTAINTIES:

The following uncertainties exist :

1. *Uncertainty associated with the weighting process.*
2. *Uncertainty associated with air density.*
3. *Uncertainty associated with the measurement standard.*
4. *Uncertainty associated with the density of the mass being calibrated.*

The uncertainty of the weighing process includes long-term reproducibility.

Uncertainties specified in this report are expanded uncertainties representing a confidence level of approximately 95% obtained by multiplying the combined standard uncertainty by a coverage factor of  $k = 2$ . For more detailed information refer to the GUM (Guide to the Expression of Uncertainty in Measurement, 1995 Edition)

### TRACEABILITY

The Calibration Laboratory Assessment Service (CLAS) of the National Research Council of Canada (NRC) has assessed and certified specific calibration capabilities of this laboratory and their traceability to recognized national measurement standards and to the International System of Units (SI). This certificate of calibration is issued in accordance with the conditions of certification granted by CLAS and the conditions of accreditation granted by the Standards Council of Canada (SCC). ### BALANCES

The following balances are used for calibration purposes :

> 5 kg to 25 kg :	Mettler Toledo XP32003L, SNR 1123271214, max. 32100 g, d = 0.005 g
> 1 kg to 5 kg :	Mettler Toledo PR5003, SNR 1115311634, max. 5100 g, d = 0.001 g
> 300 g to 2 kg :	Mettler Toledo XP2004S, SNR B131185222, max. 2100 g, d = 0.1 mg
> 100 g to 200 g :	Mettler Toledo AT201 SNR BA1115230146, max. 205 g, d = 0.01 mg
> 5 g to 100 g :	Mettler Toledo AX106 SNR 1127063924, max. 111 g, d = 1 µg
1 mg to 5 g :	Mettler UMX5, SNR 1121103055, max. 5.1 g, d = 0.1 µg

We are also using these balances in our automated procedure :

> 200 g to 1 kg :	Mettler Toledo AX1005 SNR 1127063210, max. 1109 g, d = 0.01 mg
> 5 g to 100 g :	Mettler Toledo AX106 SNR 1120143015, max. 111 g, d = 1 µg
1 mg to 5 g :	Mettler UMX5, SNR 1125140561, max. 5.1 g, d = 0.1 µg

*Our balances are periodically verified, according to our PDL-11-MG-001 control procedure.*

### UNCERTAINTIES:

The following uncertainties exist :

1. *Uncertainty associated with the weighting process.*
2. *Uncertainty associated with air density.*
3. *Uncertainty associated with the measurement standard.*
4. *Uncertainty associated with the density of the mass being calibrated.*

The uncertainty of the weighing process includes long-term reproducibility.

Uncertainties specified in this report are expanded uncertainties representing a confidence level of approximately 95% obtained by multiplying the combined standard uncertainty by a coverage factor of  $k = 2$ . For more detailed information refer to the GUM (Guide to the Expression of Uncertainty in Measurement, 1995 Edition)

### TRACEABILITY

The Calibration Laboratory Assessment Service (CLAS) of the National Research Council of Canada (NRC) has assessed and certified specific calibration capabilities of this laboratory and their traceability to recognized national measurement standards and to the International System of Units (SI). This certificate of calibration is issued in accordance with the conditions of certification granted by CLAS and the conditions of accreditation granted by the Standards Council of Canada (SCC). Neither the CLAS nor the SCC guarantees the accuracy of individual calibration by accredited laboratories.

**QUALITY PROGRAM CONFORMANCE**

All calibrations are performed in accordance with Polycontrols Laboratory Quality Assurance Manual and conform to ISO/IEC 17025: 2017, ISO 9001 – 2015 and/or other quality requirements defined in customers purchase descriptions. The results are strictly valid for the device under test or calibration. If applicable, the decision rule is described in the certificate.

**TRACEABILITY**

The traceability for flow standard to the National Institute of Standards and Technology, NIST, is maintained by Fluke Corporation of Phoenix, Arizona and conform to ISO/IEC 17025, ANSI/NCSL Z540-1-1994, ISO-10012-1 and MIL-STD 45662A.

The Calibration Laboratory Assessment Service (CLAS) of the National Research Council of Canada (NRC) has assessed and certified specific calibration capabilities of this laboratory and traceability to the International System of Units (SI) or to standards acceptable to the CLAS program. This certificate of calibration is issued in accordance with the conditions of certification granted by CLAS and the conditions of accreditation granted by the Standards Council of Canada (SCC). Neither CLAS nor SCC guarantee the accuracy of individual calibrations by accredited laboratories.

**CALIBRATION AND MEASUREMENT CAPABILITY**

Calibration measurement capabilities have an uncertainty of  $\pm 0.2\%$  of reading for a flow range between 5 SCCM to 10 SLPM,  $\pm 0.3\%$  of reading for a flow range between 10 SLPM to 30 SLPM,  $\pm 0.2\%$  of reading for a flow range between 30 SLPM to 3000 SLPM,  $\pm 0.3\%$  of reading for a flow range above 3000 SLPM to 6000 SLPM and  $\pm 0.5\%$  of reading for a flow range under 5 SCCM down to 1 SCCM, air or nitrogen equivalent. The reported uncertainty is expanded using a coverage factor  $k=2$  for a level of confidence of approximately 95%, assuming a normal distribution including resolution of the instrument. The test uncertainty ratio (TUR) of this calibration is at least 4:1 unless otherwise stated.

*Appendix for the decision rule*

**Method #3 Non-binary Statement with Guard Band, uncertainty directly taken into account**

This decision rule uses a guard band to define the acceptance and rejection interval. The acceptance limit is defined by the following mathematical formula  $AL = TL - w$  and the rejection limit  $RL = TL + w$ , where  $w = rU$ . The multiple  $r$  that is multiplied by the expanded measurement uncertainty  $U$  can be defined following ILAC G8: 2019 table 1 section 5.2. The expanded measurement uncertainty  $U$  has a 95% coverage probability ( $k = 2$ ). Non-binary statement with guard band exists when the result is limited to four choices: pass, conditional pass, conditional fail, and fail.

Statements of conformity are reported as:

*Graphical representation of a Non-Binary Statement with a Guard Band*

**Case 1 – Below acceptance limit AL.**

**Status: In tolerance**

- The result is inside the acceptance interval. However, assuming a normal distribution, the risk that the result is outside the tolerance limit could be up to 2.5%. Uncertainty is directly taken into account. Green.

**Case 2 – Below tolerance limit TL, greater than acceptance limit AL.**

**Status: In tolerance-Conditional**

- The result is outside the acceptance interval but below tolerance limit. However, the observed value is inside the guard band  $w = TL - AL$  and the status is conditional on the customer's risk assessment. Uncertainty is directly taken into account. Yellow.

**Case 3 – Greater than tolerance limit, below rejection limit RL.**

**Status: Out of tolerance-Conditional**

**QUALITY PROGRAM CONFORMANCE**

All calibrations are performed in accordance with Polycontrols Laboratory Quality Assurance Manual and conform to ISO/IEC 17025: 2017, ISO 9001 – 2015 and/or other quality requirements defined in customers purchase descriptions. The results are strictly valid for the device under test or calibration. If applicable, the decision rule is described in the certificate.

**TRACEABILITY**

The traceability for flow standard to the National Institute of Standards and Technology, NIST, is maintained by Fluke Corporation of Phoenix, Arizona and conform to ISO/IEC 17025, ANSI/NCSL Z540-1-1994, ISO-10012-1 and MIL-STD 45662A.

The Calibration Laboratory Assessment Service (CLAS) of the National Research Council of Canada (NRC) has assessed and certified specific calibration capabilities of this laboratory and traceability to the International System of Units (SI) or to standards acceptable to the CLAS program. This certificate of calibration is issued in accordance with the conditions of certification granted by CLAS and the conditions of accreditation granted by the Standards Council of Canada (SCC). Neither CLAS nor SCC guarantee the accuracy of individual calibrations by accredited laboratories.

**CALIBRATION AND MEASUREMENT CAPABILITY**

Calibration measurement capabilities have an uncertainty of  $\pm 0.2\%$  of reading for a flow range between 5 SCCM to 10 SLPM,  $\pm 0.3\%$  of reading for a flow range between 10 SLPM to 30 SLPM,  $\pm 0.2\%$  of reading for a flow range between 30 SLPM to 3000 SLPM,  $\pm 0.3\%$  of reading for a flow range above 3000 SLPM to 6000 SLPM and  $\pm 0.5\%$  of reading for a flow range under 5 SCCM down to 1 SCCM, air or nitrogen equivalent. The reported uncertainty is expanded using a coverage factor  $k=2$  for a level of confidence of approximately 95%, assuming a normal distribution including resolution of the instrument. The test uncertainty ratio (TUR) of this calibration is at least 4:1 unless otherwise stated.

*Appendix for the decision rule*

**Method #3 Non-binary Statement with Guard Band, uncertainty directly taken into account**

This decision rule uses a guard band to define the acceptance and rejection interval. The acceptance limit is defined by the following mathematical formula  $AL = TL - w$  and the rejection limit  $RL = TL + w$ , where  $w = rU$ . The multiple  $r$  that is multiplied by the expanded measurement uncertainty  $U$  can be defined following ILAC G8: 2019 table 1 section 5.2. The expanded measurement uncertainty  $U$  has a 95% coverage probability ( $k = 2$ ). Non-binary statement with guard band exists when the result is limited to four choices: pass, conditional pass, conditional fail, and fail.

Statements of conformity are reported as:

*Graphical representation of a Non-Binary Statement with a Guard Band*

**Case 1 – Below acceptance limit AL**

**Status: In tolerance**

- The result is inside the acceptance interval. However, assuming a normal distribution, the risk that the result is outside the tolerance limit could be up to 2.5%. Uncertainty is directly taken into account. Green.

**Case 2 – Below tolerance limit TL, greater than acceptance limit AL**

**Status: In tolerance-Conditional**

- The result is outside the acceptance interval but below tolerance limit. However, the observed value is inside the guard band  $w = TL - AL$  and the status is conditional on the customer's risk assessment. Uncertainty is directly taken into account. Yellow.

**Case 3 – Greater than tolerance limit, below rejection limit RL**

**Status: Out of tolerance-Conditional**

- The result is greater than tolerance limit but outside the rejection interval. However, the observed value is inside the guard band  $w = TL - RL$  and the status is conditional on the customer's risk assessment. Uncertainty is directly taken into account. Yellow.

**Case 4 – Greater than rejection limit RL**

**Status: Out of tolerance**

- The result is inside the rejection interval. Uncertainty is directly taken into account. Red.

### UNCERTAINTIES:

The following uncertainties exist :

1. *Uncertainty associated with the weighting process.*
2. *Uncertainty associated with air density.*
3. *Uncertainty associated with the measurement standard.*
4. *Uncertainty associated with the density of the mass being calibrated.*

The uncertainty of the weighing process includes long-term reproducibility.

Uncertainties specified in this report are expanded uncertainties representing a confidence level of approximately 95% obtained by multiplying the combined standard uncertainty by a coverage factor of  $k = 2$ . For more detailed information refer to the GUM (Guide to the Expression of Uncertainty in Measurement, 1995 Edition)

### TRACEABILITY

The Calibration Laboratory Assessment Service (CLAS) of the National Research Council of Canada (NRC) has assessed and certified specific calibration capabilities of this laboratory and their traceability to recognized national measurement standards and to the International System of Units (SI). This certificate of calibration is issued in accordance with the conditions of certification granted by CLAS and the conditions of accreditation granted by the Standards Council of Canada (SCC). Neither the CLAS nor the SCC guarantees the accuracy of individual calibration by accredited laboratories.

Alpha Controls & Instrumentation Inc. certifies this instrument was calibrated on the date shown using standards traceable to NIST/NRC or accepted intrinsic standards and in compliance with ISO/IEC-17025:2017 and ANSI/NCSL Z540-1.

Any statement of compliance is made without taking measurement uncertainty into account and is based on UUT performance against required tolerance only. The customer must ensure equipment calibrated meets the intended use.

Tolerance is based on manufacturer specification if not stated otherwise. Calibration results relate to items calibrated only.

*Appendix for the decision rule*

**Method #3 Non-binary Statement with Guard Band, uncertainty directly taken into account**

This decision rule uses a guard band to define the acceptance and rejection interval. The acceptance limit is defined by the following mathematical formula  $AL = TL - w$  and the rejection limit  $RL = TL + w$ , where  $w = rU$ . The multiple  $r$  that is multiplied by the expanded measurement uncertainty  $U$  can be defined following ILAC G8: 2019 table 1 section 5.2. The expanded measurement uncertainty  $U$  has a 95% coverage probability ( $k = 2$ ). Non-binary statement with guard band exists when the result is limited to four choices: pass, conditional pass, conditional fail, and fail.

Statements of conformity are reported as:

*Graphical representation of a Non-Binary Statement with a Guard Band*

**Case 1 – Below acceptance limit AL**

**Status: In tolerance**

- The result is inside the acceptance interval. However, assuming a normal distribution, the risk that the result is outside the tolerance limit could be up to 2.5%. Uncertainty is directly taken into account. Green.

**Case 2 – Below tolerance limit TL, greater than acceptance limit AL**

**Status: In tolerance-Conditional**

- The result is outside the acceptance interval but below tolerance limit. However, the observed value is inside the guard band  $w = TL - AL$  and the status is conditional on the customer's risk assessment. Uncertainty is directly taken into account. Yellow.

**Case 3 – Greater than tolerance limit, below rejection limit RL**

**Status: Out of tolerance-Conditional**

- The result is greater than tolerance limit but outside the rejection interval. However, the observed value is inside the guard band  $w = TL - RL$  and the status is conditional on the customer's risk assessment. Uncertainty is directly taken into account. Yellow.

**Case 4 – Greater than rejection limit RL**

**Status: Out of tolerance**

- The result is inside the rejection interval. Uncertainty is directly taken into account. Red.

The following uncertainties exist :

1. *Uncertainty associated with the weighting process.*
2. *Uncertainty associated with air density.*
3. *Uncertainty associated with the measurement standard.*
4. *Uncertainty associated with the density of the mass being calibrated.*

The uncertainty of the weighing process includes long-term reproducibility.

Uncertainties specified in this report are expanded uncertainties representing a confidence level of approximately 95% obtained by multiplying the combined standard uncertainty by a coverage factor of  $k = 2$ . *Our balances are periodically verified, according to our PDL-11-MG-001 control procedure.*

### UNCERTAINTIES:

The following uncertainties exist :

1. *Uncertainty associated with the weighting process.*
2. *Uncertainty associated with air density.*
3. *Uncertainty associated with the measurement standard.*
4. *Uncertainty associated with the density of the mass being calibrated.*

The uncertainty of the weighing process includes long-term reproducibility.

Uncertainties specified in this report are expanded uncertainties representing a confidence level of approximately 95% obtained by multiplying the combined standard uncertainty by a coverage factor of  $k = 2$ . For more detailed information refer to the GUM (Guide to the Expression of Uncertainty in Measurement, 1995 Edition)

### TRACEABILITY

The Calibration Laboratory Assessment Service (CLAS) of the National Research Council of Canada (NRC) has assessed and certified specific calibration capabilities of this laboratory and their traceability to recognized national measurement standards and to the International System of Units (SI). This certificate of calibration is issued in accordance with the conditions of certification granted by CLAS and the conditions of accreditation granted by the Standards Council of Canada (SCC). Neither the CLAS nor the SCC guarantees the accuracy of individual calibration by accredited laboratories.

**STATEMENT OF UNCERTAINTY:** The reported expanded uncertainty of measurement is stated as the standard measurement uncertainty multiplied by the coverage factor  $K = 2$ , which for a normal distribution corresponds to a coverage probability of approximately 95 percent. Alpha Controls & Instrumentation Inc. certifies this instrument was calibrated on the date shown using standards traceable to NIST/NRC or accepted intrinsic standards and in compliance with ISO/IEC-17025:2017 and ANSI/NCSL Z540-1.

Any statement of compliance is made without taking measurement uncertainty into account and is based on UUT performance against required tolerance only. The customer must ensure equipment calibrated meets the intended use.

Tolerance is based on manufacturer specification if not stated otherwise. Calibration results relate to items calibrated only.

This certificate shall not be reproduced except in full without written approval of Alpha Controls and Instrumentation Inc.

Install the Honeywell probe into the ductwork above the unit. NOTE: The conduit is supplied at a predetermined length of approximately 3 feet

## FILTER BOX

The filter box is made up of 4 parts, plus all hardware necessary for assembly.

Assemble the filter box sides, top, and bottom using twenty (20) #10 A x 1/2 HX screws.

If your BX Cables will not match up to the previously matched arrangement on the top, carefully measure and custom notch to accommodate your particular arrangement of BX Cables. There are several different configurations.

Secure the filter box to the unit using a total of ten (10) #10 A x 1/2 HX screws, five (5) on each side.

## AIR FILTER REPLACEMENT

Insert one 16 x 24 x 1 air filter (not included).

## FLOOR PROTECTOR

The furnace must be placed on solid concrete, solid masonry, or when installed on a combustible floor, on a floor protector. The floor protector is required to provide heat, live ember, and ash protection and must be of a non-combustible, continuous solid surface to protect against infiltration of live embers and ash. Floor protection must have an R-Value of at least 1.4. Refer to floor protector manufacturer's instructions for installation directions. The floor protector or non-combustible floor must extend under the furnace and beyond each side as shown below.

## CLEARANCES TO COMBUSTIBLES

The installation of this furnace includes supplying electrical power, return air ductwork, and supply air ductwork. This furnace may be installed as a stand alone

wood furnace only. See installation section in this manual to ensure proper assembly, installation and operation of your new furnace. If installing in an area with a fan it should not be allowed to create negative pressure in the room where the furnace is installed. When locating your furnace ensure the required maintenance clearances are maintained. Your furnace must be installed as shown in this manual and in compliance with all local and national codes. It is of the utmost importance that the clearances to combustible materials be strictly adhered to during installation of the furnace. Refer to the table and diagrams below for minimum required clearances.

## DUCT WORK

We strongly recommend that the hot air ductwork be installed by a home heating specialist. If doing the installation yourself, consult a qualified heating technician and follow his recommendations as to the safest and most efficient method of installation.

## SUPPLY AIR

The supply air duct shall be constructed of metal in accordance with NFPA 90B, 2-1.1. The plenums installed to the furnace shall be constructed of metal in accordance with NFPA 90B, 2-1.3. When installing this furnace the supply air plenum is to have a minimum height of 24" (610mm) if the top of the first vertical section is not flush with the top of the first horizontal section of ductwork. If the top of the plenum is flush with the top of the first horizontal section of ductwork then the minimum height is 15" (381mm).

## RETURN AIR

The return air intake on the furnace is on the rear of the unit. The ductwork must be mechanically attached to the unit or blower box with sheet metal screws to ensure a proper operation.

## STAND ALONE INSTALLATION

When installing this stand alone furnace, ensure all local codes and all instructions in this manual are followed, including clearance to combustibles, floor protector specifications and safety warnings.

## LISTED FACTORY BUILT CHIMNEY

Your wood furnace may be hooked up with a factory built or masonry chimney, matching the diameter of the exhaust. If you are using a factory built chimney, it must comply with UL 103 or CSA-B365 standard; therefore it must be a Type HT (2100°F). It is extremely important that it be installed according to the manufacturer's specifications.

If you are using a masonry chimney, it is important that it be built in compliance with the specifications of the National Building Code. It must be lined with fire clay bricks, metal or clay tiles sealed together with fire cement. (Round flues are the most efficient).

The interior diameter of the chimney flue must be identical to the furnace smoke exhaust. A flue which is too small may cause draft problems, while a large flue favors rapid cooling of the gas, and hence the build-up of creosote and the risk of chimney fires. Note that it is the chimney and not the furnace which creates the draft effect; your furnace's performance is directly dependent on an adequate draft from your chimney.

Do not connect this unit to a chimney flue serving another appliance.

The following recommendations may be useful for the installation of your chimney:

- It must rise above the roof at least 3' (0.9m) from the uppermost point of contact.
- The exterior portion should be double or triple wall pipe to ensure proper draft.
- The chimney must exceed any part of the building or other obstruction within a 10' (3.04m) distance by a height of 2' (0.6m).
- Installation of an interior chimney is always preferable to an exterior chimney. The interior chimney will be hotter than an exterior chimney that is being cooled by the ambient air outside the house. Therefore the gas which circulates will cool slower, thus reducing the build-up of creosote and the risk of chimney fires.
- The draft caused by the tendency for hot air to rise will be increased with an interior chimney.
- Using a fire screen at the extremity of the chimney requires regular inspection in order to ensure that it is not obstructed thus blocking the draft, and it should be cleaned when used regularly.

## IMPORTANCE OF PROPER DRAFT

Draft is the force which moves air from the appliance up through the chimney. The amount of draft in your chimney depends on the length of the chimney, local geography, nearby obstructions and other factors. Too

much draft may cause excessive temperatures in the appliance. Inadequate draft may cause back puffing into the room and ‘plugging’ of the chimney. Inadequate draft will cause the appliance to leak smoke into the room through appliance and chimney connector joints. An uncontrollable burn or excessive temperature indicates excessive draft. Do not operate with the flue draft exceeding .06 water column/14.93 Pascals. The draft can be checked with a draft gauge or manometer. Take into account the chimney’s location to ensure it is not too close to neighbors or in a valley which may cause unhealthy or nuisance conditions.

## MASONRY CHIMNEY

### CAUTION:

**BE SURE THAT IF A MASONRY CHIMNEY IS USED, IT IS SAFELY CONSTRUCTED AND IN GOOD REPAIR. HAVE THE CHIMNEY INSPECTED BY THE FIRE DEPARTMENT OR AN INSPECTOR.**

Ensure that a masonry chimney meets the minimum standards of the National Fire Protection Association (NFPA) by having it inspected by a professional. Make sure there are no cracks, loose mortar or other signs of deterioration and blockage. Have the chimney cleaned

before the furnace is installed and operated. When connecting the furnace through a combustible wall to a masonry chimney, special methods are needed as explained in the “Combustible Wall Chimney Connector Pass-Throughs” Section.

### WARNING:

**DO NOT CONNECT THIS FURNACE TO A CHIMNEY FLUE SERVING ANOTHER APPLIANCE.**

## COMBUSTIBLE WALL CHIMNEY CONNECTOR PASS-THROUGHS

**METHOD A - 12” (304.8 mm) Clearance to Combustible Wall Member:** Using a minimum thickness 3.5” (89 mm) brick and a 5/8” (15.9 mm) minimum wall thickness clay liner, construct a wall pass-through. The clay liner must conform to ASTM C315 (Standard Specification for Clay Fire Linings) or its equivalent. Keep a minimum of 12” (304.8 mm) of brick masonry between the clay liner and wall combustibles. The clay liner shall run from the brick masonry outer surface to the inner surface of the chimney flue liner but not past the inner surface. Firmly grout or cement the clay liner in place to the chimney flue liner.

**METHOD B - 9” (228.6 mm) Clearance to Combustible Wall Member:** Using a 6” (152.4 mm) inside diameter, listed, factory-built Solid-Pak chimney section with insulation of 1” (25.4 mm) or more, build a wall pass-through with a minimum 9” (228.6 mm) air space between the outer wall of the chimney length and wall combustibles. Use sheet metal supports fastened securely to wall surfaces on all sides, to maintain the 9” (228.6 mm) air space. When fastening supports to chimney length, do not penetrate the chimney liner (the inside wall of the Solid-Pak chimney). The inner end of the Solid-Pak chimney section shall be flush with the inside of the masonry chimney flue, and sealed with a non-water soluble refractory cement. Use this cement to also seal to the brick masonry penetration.

**METHOD C - 6" (152.4 mm) Clearance to Combustible Wall Member:** Starting with a minimum 24 gage (.024" [.61 mm]) 6" (152.4 mm) metal chimney connector, and a minimum 24 gage ventilated wall thimble which has two air channels of 1" (25.4 mm) each, construct a wall pass-through. There shall be a minimum 6" (152.4 mm) separation area containing fiberglass insulation, from the outer surface of the wall thimble to wall combustibles. Support the wall thimble, and cover its opening with a 24-gage minimum sheet metal support. Maintain the 6" (152.4 mm) space. There should also be a support sized to fit and hold the metal chimney connector. See that the supports are fastened securely to wall surfaces on all sides. Make sure fasteners used to secure the metal chimney connector do not penetrate chimney flue liner.

**METHOD D - 2" (50.8 mm) Clearance to Combustible Wall Member:** Start with a solid-pak listed factory built chimney section at least 12" (304 mm) long, with insulation of 1" (25.4 mm) or more, and an inside diameter of 8" (2 inches [51 mm] larger than the 6" [152.4 mm] chimney connector). Use this as a pass-through for a minimum 24-gauge single wall steel chimney connector. Keep solid-pak section concentric with and spaced 1" (25.4 mm) off the chimney connector by way of sheet metal support plates at both ends of chimney section. Cover opening with and support chimney section on both sides with 24 gage minimum sheet metal supports. See

that the supports are fastened securely to wall surfaces on all sides. Make sure fasteners used to secure chimney flue line do not penetrate the inner liner.

**NOTES:**

- Connectors to a masonry chimney, excepting method B, shall extend in one continuous section through the wall pass-through system and the chimney wall, to but not past the inner flue liner face.
- A chimney connector shall not pass through an attic or roof space, closet or similar concealed space, or a floor, or ceiling.

**CHIMNEY CONNECTOR**

Your chimney connector and chimney must have the same diameter as the furnace outlet. If this is not the case, we recommend you contact your dealer in order to ensure there will be no problem with the draft.

The furnace pipe must be made of aluminized or cold roll steel with a minimum thickness of 0.021" or 0.53 mm. It is strictly forbidden to use galvanized steel.

Your connector should be assembled in such a way that the male section (crimped end) of the pipe faces down. Attach each of the sections to one another with three equidistant metal screws. Seal the joints with furnace cement.

The pipe must be short and straight. All sections installed horizontally must slope at least 1/4 inch per foot, with the upper end of the section toward the chimney. Any installation with a horizontal run of furnace pipe must conform to NFPA 211. You may contact NFPA (National Fire Protection Association) and request the latest edition of the NFPA Standard 211.

To ensure a good draft, the total length of the furnace pipe should never exceed 8' to 10' (2.4m to 3.04 m). (Except for cases of vertical installation, cathedral-roof style where the smoke exhaust system can be much longer and connected without problem to the chimney at the ceiling of the room).

There should never be more than two 90 degrees elbows in the smoke exhaust system.

Installation of a "barometric draft stabilizer" (fireplace register) on a smoke exhaust system is prohibited.

Do not use with a flue damper. With a controlled combustion wood furnaces the draft is regulated upon intake of the combustion air in the furnace and not at the exhaust.

## FACTORY BUILT CHIMNEY

When a metal prefabricated chimney is used, the manufacturer's installation instructions must be followed. You must also purchase (from the same manufacturer) and install the ceiling support package or wall pass-through and "T" section package, firestops (where needed), insulation shield, roof flashing, chimney cap, etc. Maintain proper clearance to the structure as recommended by the manufacturer. The chimney must be the required height above the roof or other obstructions for safety and proper draft operation.

Your heating appliance was designed to burn well seasoned natural wood only; no other materials should be burned. Any type of well seasoned natural wood

may be used in your stove, but specific varieties have better energy yields than others. Higher efficiencies and lower emissions generally result when burning air dried seasoned hardwoods, as compared to softwoods or too green or freshly cut hardwoods. The following resources can assist in learning the burn characteristics of various species of wood:

<http://firewoodresource.com/firewood-btu-ratings/>; or <https://forestry.usu.edu/forest-products/wood-heating>

The operation of this wood furnace in a manner inconsistent with the owner's manual will void your warranty and is also against federal regulations. Waste and other flammable materials should not be burned in your stove. DO NOT BURN:

1. Garbage;
2. Lawn clippings or yard waste;
3. Materials containing rubber, including tires;
4. Materials containing plastic;
5. Waste petroleum products, paints or paint thinners, or asphalt products;
6. Materials containing asbestos;
7. Construction or demolition debris;
8. Railroad ties or pressure-treated wood;
9. Manure or animal remains;
10. Saltwater driftwood or other previously salt water-saturated materials;
11. Unseasoned wood; or
12. Paper products, cardboard, plywood, or particleboard. The prohibition against burning these materials does not prohibit the use of fire starters made from paper, cardboard, sawdust, wax, and similar substances to start a fire in an affected wood furnace.

Burning these materials may result in the release of toxic fumes or render the furnace ineffective and cause smoke. Deadwood lying on the forest floor should be considered wet and requires full seasoning time. Standing deadwood can usually be considered to be about 2/3 seasoned. Smaller pieces of wood will dry faster. All logs exceeding 6" in diameter should be split. The wood should not be stored directly on the ground. Air should circulate through the logs. A 24" to 48" air space should be left between each row of logs, which should be placed in the sunniest location possible. The upper layer of wood should be protected from the element but not the sides. A good indicator of if the wood is ready to burn is to check the

piece ends. If cracks are radiating in all directions from the center then the wood should be dry enough to burn. If your wood sizzles in the fire, even though the surface is dry, it may not be fully cured and should be seasoned longer. It is **EXTREMELY IMPORTANT** that you use **DRY WOOD** only in your wood stove. The wood should have dried for 9 to 15 months, such that the humidity content (in weight) is reduced below 20% of the weight of the log. It is very important to keep in mind that even if the wood has been cut for one, two, or even more years, it is not necessarily dry, if it has been stored in poor conditions. Under extreme conditions, it may rot instead of drying. This point cannot be overstressed; the vast majority of the problems related to the operation of a wood stove is caused by the fact that the wood used was too damp or had dried in poor conditions. These problems can be:

- ignition problems
- creosote build-up causing chimney fires
- low energy yield
- blackened windows
- incomplete log combustion

**Do not burn manufactured logs made of wax impregnated sawdust or logs with any chemical additives.** Manufactured logs made of 100% compressed sawdust can be burned, but be careful burning too much of these logs at the same time. Start with one manufactured log and see how the stove reacts. You can increase the number of logs burned at a time but make sure the temperature never rises higher than 475 °F (246 °C) on a magnetic thermometer for installation on single wall stove pipes. The thermometer should be placed about 18" (457 mm) above the stove. Higher temperatures can lead to overheat and damage your stove.

## TESTING YOUR WOOD

- When the furnace is thoroughly warmed, place one piece of split wood (about five inches in diameter) parallel to the door on the bed of red embers.
- Adjust all air controls to their maximum settings and close the door. If ignition of the piece is accomplished within 90 seconds from the time it was placed in the furnace, your wood is correctly dried. If ignition takes longer, your wood is damp.

If your wood hisses and water or vapor escapes at the ends of the piece, your wood is soaked or freshly cut (green). Do not use this wood in your stove. Large amounts of creosote could be deposited in your chimney, creating potential conditions for a chimney fire.

## POWER FAILURE

DO NOT add additional fuel after a power failure, remove all air filters and reduce combustion air to a minimum. Observe furnace closely until power is restored.

## TAMPER WARNING

This wood furnace has a manufacturer-set minimum low burn rate that must not be altered. It is against federal regulations to alter this setting or otherwise operate this wood furnace in a manner inconsistent with operating instructions in this manual.

## EFFICIENCIES

Efficiencies can be based on either the lower heating value (LHV) or the higher heating value (HHV) of the fuel. The lower heating value is when water leaves the combustion process as a vapor, in the case of woodstoves the moisture in the wood being burned leaves the stove as a vapor. The higher heating value is when water leaves the combustion process completely condensed. In the case of woodstoves this would assume the exhaust gases are room temperature when leaving the system, and therefore calculations using this heating value consider the heat going up the chimney as lost energy. Therefore, efficiency calculated using the lower heating value of wood will be higher than efficiency calculated using the higher heating value. The best way to achieve optimum efficiencies is to learn the burn characteristic of your appliance and burn well-seasoned wood. Higher burn rates are not always the best heating burn rates; after a good fire is established a lower burn rate may be a better option for efficient heating. A lower burn rate slows the flow of usable heat out of the home through the chimney, and it also consumes less wood.

## NOTICE - INITIAL BURNS TO CURE PAINT

BECAUSE OF THE HIGH OPERATING TEMPERATURES, THIS APPLIANCE IS COATED WITH A SPECIAL HIGH TEMP PAINT WHICH REQUIRES A SERIES OF LOW TO MEDIUM BURNS TO FULLY CURE FOR DURABILITY AND A LIFETIME OF SERVICE.

Proper curing of the high-temp paint requires a series of three initial burns. The appliance should be allowed to cool off between each burn. The first two burns should be small fires and low temperatures (250°F) for a duration of 20 minutes each. The third fire should be at a temperature of approximately 500°F for 20 minutes. Provide adequate cross ventilation to clear any smoke or odor caused by initial firings.

**Notice: Use solid wood fuel only! Do not burn garbage, or flammable fluids. Do not use coal. This appliance**

**is not designed to accommodate the air flow (draft) required to properly burn coal or coal products. Do not elevate the fire using grates or irons. Build the fire directly on the firebrick.**

## FUELING INSTRUCTIONS

To ensure this unit produces the optimal minimum emissions it is critical that only well-seasoned cordwood is burned. Burning unseasoned wet wood only hurts your stoves efficiency and leads to accelerated creosote buildup in your chimney. Be considerate of the environment and only burn dry wood.

<b>CAUTION:</b>
<b>DO NOT LEAVE APPLIANCE UNATTENDED WITH THE DOOR OPEN.</b>

## GENERAL FURNACE OPERATION

### Honeywell Limit Control

This device, mounted in the ductwork, just above the air discharge atop the furnace, works in conjunction with a wall thermostat, operating the distribution blowers and the combustion fan on the rear of the furnace. The factory settings are 100/150/200. The wall thermostat setting operates the ON time of the combustion fan. If the temperature is below the setting on the wall thermostat, the combustion fan will come ON. (Recommended setting at 5 to 10 degrees higher than other heating thermostats.) The first two set points on the limit control operates the distribution blowers. When the furnace plenum temperature reaches the second set point on the limit control, the distribution blowers will come on. If the temperature falls to the first set point, the distribution blower will shut-off. When the furnace reaches the third set point on the limit control, the combustion fan

will shut-off. Once the temperature falls below that set point and the wall thermostat is still calling for heat, the combustion fan will turn back ON. The 200° is a Factory Preset Limit for the combustion fan and should never be changed. Doing so could result in excessive firebox temperatures and could permanently damage your firebox.

## FURNACE LOADING PROCEDURE

### Starting your Furnace

- When lighting the furnace, the wall thermostat should be set to its MAX setting so that the combustion fan is ON. Start the fire with approximately 12 lbs. of kindling, which will be several small strips of wood, 1-1/2 to 2-1/2 inches wide, approximately 12 to 15 inches deep in the bottom of the firebox. Leave the fuel loading door slightly open to ensure good ignition of the kindling. Make sure the combustion fan is ON and its damper is closed, then pull the knob/loop on the front of the unit to prop open the barometric dampers.
- Once the kindling is fully ignited, add another 12 to 15 lbs. of kindling, which will be around the same amount as the initial load.
- Leave the door slightly open for three to five minutes (3-5 min) to ensure full ignition of the second kindling load.
- After the second load of kindling is fully ignited, you can close the door and push the knob/loop on the front of the unit back in to allow the barometric dampers to function freely. After 15 minutes, fully open the damper on the combustion fan.
- Once the kindling burns down to about 8 lbs., which should be to the point that the kindling will break up into a full bed of coals, the preload can be added into the firebox. The preload should consist of around 40 pounds of properly seasoned cord wood, which should be about 6 to 8 pieces of wood.
- After loading the preload, close the door, and make certain the combustion fan is ON.
- Allow about one hour (1hr) for the preload to burn down to around 10-12 lbs. or when all the preload wood will break up into coals. You should now have a coal bed that is several inches deep in the bottom of the firebox.
- The purpose of the preload burn is to establish a proper coal bed prior to inserting the main load of wood. Having a proper coal bed is the key to a complete ignition of the main wood load and to maintain the correct firebox temperatures to get the best emissions and efficiency output of the furnace.

- After you have completed the preload burn, you may insert your main firewood load.
- The main load should be the same size or amount as the preload, approximately 40 pounds of cord wood, 6 to 8 pieces.
- Try to keep gaps between the pieces of wood to help with the ignition and maintain a good fire.

## MAIN FIREWOOD LOAD

- Ensure that the combustion fan is ON, and open the feed door to insert the main firewood load.
- After loading, leave the feed door slightly open for five minutes (5 min) to ensure proper ignition, then close the door.
- The damper on the combustion fan should be open.
- Depending on the temperature at which the wall thermostat is set, this will determine the burn duration of the main load. A lower setting on the thermostat should result in a longer burn time as this would allow the combustion fan to remain OFF for longer periods. A higher thermostat setting will cycle the combustion blower ON/OFF more often, resulting in a hotter, but shorter duration burn time of course. However, colder outside temperatures and your home's construction (insulation) will play a big factor in how well the thermostat can maintain it's set temperature.

## VISIBLE SMOKE

The amount of visible smoke being produced can be an effective method of determining how efficiently the combustion process is taking place at the given settings. Visible smoke consist of unburned fuel and moisture leaving your stove. Learn to adjust the air settings of your specific unit to produce the smallest amount of visible smoke. Wood that has not been seasoned properly and has a high wood moisture content will produce excess visible smoke and burn poorly. Use the included moisture meter to ensure your wood has a 20% or less moisture content.

## AIR TUBES

The air tubes assembled in this unit are designed to provide an accurate mix of secondary air to ensure the highest efficiency. Any damage or deterioration of these tubes may reduce the efficiency of combustion. The air tubes are held in position by screws or snap pins. Locate these to either side of the tube and remove it to allow the tube to be removed and replaced.

## NEVER OPERATE THIS PRODUCT WHILE UNATTENDED

**CAUTION:**

**DO NOT OVERFIRE APPLIANCE. YOU ARE OVERFIRING IF ANY PART OF THE APPLIANCE GLOWS RED. CLOSE THE DOOR AND SHUT DAMPER IMMEDIATELY TO REDUCE THE AIR SUPPLY AND SLOW DOWN THE FIRE.**

**CAUTION:**

**SLOW BURNING FIRES FOR EXTENDED USE OR BURNING GREEN WOOD MAY CAUSE EXCESSIVE CREOSOTE BUILD-UP. IGNITION OF CREOSOTE OR OVERFIRING COULD CAUSE A CHIMNEY FIRE. CHIMNEY FIRES BURN EXTREMELY HOT AND MAY IGNITE SURROUNDING COMBUSTIBLE MATERIALS. IN CASE OF A CHIMNEY FIRE, CALL THE FIRE DEPARTMENT IMMEDIATELY!**

### CREOSOTE & SOOT - FORMATION & NEED FOR REMOVAL

When wood is burned slowly, the products of combustion combine with moisture to form a soot residue which accumulates on the flue lining. When ignited, this soot makes an extremely hot fire. The chimney should be inspected at least twice monthly during the heating season to determine if a creosote or soot build up has occurred. If creosote or soot has accumulated, it should be removed to reduce the risk of a chimney fire. Chimney fires burn very hot. If the chimney catches fire, immediately call the fire department, then reduce the fire by closing the inlet air control. Pour a large quantity of coarse salt, baking soda or cool ashes on top of the fire in the firebox.

**CREOSOTE ACCUMULATION CAUSES CHIMNEY FIRES. YOU SHOULD CHECK (OR HAVE CHECKED BY A QUALIFIED CHIMNEY SWEEP) YOUR CHIMNEY FOR CREOSOTE DEPOSITS AT LEAST MONTHLY DURING THE HEATING SEASON. ANY ACCUMULATIONS SHOULD BE REMOVED. COMPLETE CHIMNEY INSPECTIONS AND CLEANING SHOULD BE CONDUCTED ANNUALLY; TYPICALLY, THIS TASK SHOULD BE PERFORMED PRIOR TO EACH HEATING SEASON. IF USING AN EXISTING CHIMNEY, IT MUST BE INSPECTED PRIOR TO THE INSTALLATION OF YOUR NEW WOOD STOVE.**

**CAUTION**

**A CHIMNEY FIRE MAY CAUSE IGNITION OF WALL STUDS OR RAFTERS WHICH YOU THOUGHT WERE A SAFE DISTANCE FROM THE CHIMNEY. IF YOU HAVE A CHIMNEY FIRE, HAVE YOUR CHIMNEY INSPECTED BY A QUALIFIED PERSON BEFORE USING AGAIN.**

**ATTENTION:**

**THIS FURNACE NEEDS PERIODIC INSPECTION AND REPAIR FOR PROPER OPERATION. IT IS AGAINST FEDERAL REGULATIONS TO OPERATE THIS FURNACE IN A MANNER INCONSISTENT WITH OPERATING INSTRUCTIONS IN THIS MANUAL.**

### TO PREVENT CREOSOTE BUILD UP

- Always burn dry wood. This allows clean burns and higher chimney temperatures, therefore less creosote deposit.
- Always check for creosote deposit once every two months and have your chimney cleaned at least once a year.
- If a chimney or creosote fire occurs, close all dampers immediately. Wait for the fire to go out and the furnace to cool, then inspect the chimney for damage. If no damage results, perform a chimney cleaning to ensure no more creosote deposits is remaining in the chimney.

**CAUTION:**

**A CHIMNEY FIRE MAY CAUSE IGNITION OF WALL STUDS OR RAFTERS WHICH WERE ASSUMED TO BE A SAFE DISTANCE AWAY FROM THE CHIMNEY. IF A CHIMNEY FIRE OCCURS, HAVE YOUR CHIMNEY INSPECTED BY A QUALIFIED EXPERT BEFORE USING AGAIN.**

## ASH REMOVAL & DISPOSAL

Never let your ashes get any higher than the pilot air hole. Remove ashes as needed leaving at least 2 inches of ash in the bottom of the firebox. Ashes should be placed in a metal container with a tight-fitting lid. The closed container of ashes should be placed on a noncombustible floor or on the ground, away from all combustible materials, pending final disposal. The ashes should be retained in the closed container until all cinders have thoroughly cooled.

### CAUTIONS:

- **ASHES COULD CONTAIN HOT EMBERS EVEN AFTER TWO DAYS WITHOUT OPERATING THE STOVE.**
- **THE ASH PAN CAN BECOME VERY HOT. WEAR GLOVES TO PREVENT INJURY.**
- **NEVER BURN THE STOVE WITH THE ASH TRAP OPEN. THIS WOULD RESULT IN OVER FIRING THE STOVE. DAMAGE TO THE STOVE AND EVEN HOUSE FIRE MAY RESULT.**

## SMOKE & CO MONITORS

Burning wood naturally produces smoke and carbon monoxide(CO) emissions. CO is a poisonous gas when exposed to elevated concentrations for extended periods of time. While the modern combustion systems in furnaces drastically reduce the amount of CO emitted out the chimney, exposure to the gases in closed or confined areas can be dangerous. Make sure you stove gaskets and chimney joints are in good working order and sealing properly to ensure unintended exposure. It is recommended that you use both smoke and CO monitors in areas having the potential to generate CO.

## GASKET CARE

### WARNING:

**NEVER OPERATE THE STOVE WITHOUT GASKETS OR WITH BROKEN GASKETS. DAMAGE TO THE STOVE OR EVEN HOUSE FIRE MAY RESULT.**

It is recommended that you change the door gasket (which makes your furnace door air tight) once a year, in order to ensure good control over the combustion, maximum efficiency and security. To change the door gasket, simply remove the damaged one. Carefully clean the available gasket groove, apply a high temperature silicone sold for this purpose and install the new gasket. You may light up your furnace again approximately 24 hours after having completed this operation. This unit's feed door uses a 5/8" diameter rope gasket. The door glass on this unit uses a 1 x 1/8 gasket.

### ATTENTION:

**THIS WOOD FURNACE NEEDS PERIODIC INSPECTION AND REPAIR FOR PROPER OPERATION. IT IS AGAINST FEDERAL REGULATIONS TO OPERATE THIS WOOD FURNACE IN A MANNER INCONSISTENT WITH OPERATING INSTRUCTIONS IN THIS MANUAL.**

## SERVICE HINTS

Do not expect a furnace to draw. It is the chimney that creates the draft. Smoke spillage into the house or excessive build-up of water or creosote in the chimney are warnings that the chimney is not functioning properly. Correct the problem before using furnace. Possible causes are:

1. The connector pipe may be pushed into the chimney too far, stopping the draft.
2. Do not connect two furnaces or a stove and furnace into the same chimney flue.
3. The chimney used for a furnace must not be used to ventilate the cellar or basement. If there is a cleanout opening at the base of the chimney, it must be closed tightly.
4. If the chimney is operating too cool, water will condense in the chimney and run back into the furnace. Creosote formation will be rapid and may block the chimney. Operate the furnace at a high enough fire to keep the chimney warm, preventing this condensation.

5. If the fire burns well, but sometimes smokes or burns slowly, it may be caused by the chimney top being lower than another part of the house or a nearby tree. The wind blowing over a house or a tree, falls on top of the chimney like water over a dam, beating down the smoke. The top of the chimney should be at least 3 feet above the roof and be at least 2 feet higher than any point of the roof within 10 feet.

## CARING FOR PAINTED PARTS

This furnace has a painted outside jacket, which is durable, but it will not stand rough handling or abuse. When installing your furnace, use care in handling. Clean with soap and warm water when furnace is not hot. DO NOT use any acids or scouring soap, as these wear and dull the finish. DISCOLORATION WILL OCCUR IF THE FURNACE IS OVERHEATED. FOLLOW OPERATING INSTRUCTIONS CAREFULLY.

<p style="text-align: center;"><b>CAUTION:</b></p> <p><b>THE SPECIAL PAINTS USED ON YOUR FURNACE MAY GIVE OFF SOME SMOKE WHILE THEY ARE CURING DURING FIRST FEW FIRES., BUILD SMALL FIRES AT FIRST. THE METAL USED IN CONSTRUCTION OF THE FURNACE AND DUCT WORK HAS A LIGHT COATING OF OIL. THIS COULD GIVE OFF SMOKE AND/OR ODOR FROM REGISTERS WHEN FURNACE IS USED FOR THE FIRST TIME. THIS SHOULD DISAPPEAR AFTER A SHORT PERIOD OF TIME. ONCE THIS BURN-OFF HAS OCCURRED, IT SHOULD NOT REOCCUR.</b></p>

Nettoyer régulièrement l'échangeur de chaleur, le tuyau de fumée, et la cheminée à fin d'éviter l'accumulation de crésote ou de carbone. Pour éviter la corrosion en été, nettoyez l'échangeur de chaleur, le tuyau de fumée, et la cheminée à la fin de la saison de chauffage. Il faut bien maintenir l'outil, le tuyau de fumée, la cheminée, et aussi l'inducteur d'air si vous en utilisez. Pour empêcher la sortie de fumée et d'étincelles, avant d'ouvrir entièrement la porte de remplissage de carburant, entrouvrir la porte pendant 10 secondes. - Non-USSC venting components, hearth components or other accessories used in conjunction with the appliance.
- USSC's obligation under this warranty does not extend to the appliance's capability to heat the desired space. Information is provided to assist the consumer and the dealer in selecting the proper appliance for the application. Consideration must be given to appliance location and configuration, environmental conditions, insulation and air tightness of the structure.
- Problems relating to smoking or creosote. Smoking is attributable to inadequate draft due to the design or installation of the flue system or installation of the heater itself. Creosote formation is largely attributable to improper operation of the unit and/or draft as mentioned above.
- Any cost associated with product removal and re-installation, travel, transportation, or shipping.
- Service calls to diagnose trouble (unless authorized in writing by the manufacturer, distributor, or dealer).

## THIS WARRANTY IS VOID IF

In no event will USSC be liable for any incidental or consequential damages. THE LIMITED WARRANTY SET FORTH HEREIN IS THE SOLE WARRANTY PROVIDED TO PURCHASER AND IS IN LIEU OF ALL OTHER WARRANTIES AND REPRESENTATIONS, EXPRESS OR IMPLIED. AND STANDARDS

Dear Mr. Bilodeau,

I am writing in response to your correspondence, dated July 9, 2019, regarding certification testing of your AirBilo PLUS brand wood-fired forced-air furnace. You are planning to use the cordwood option to obtain 2020 certification under 40 CFR 60, Subpart QQQQ - Standards of Performance for New Residential Hydronic Heaters and Forced Air Furnaces (Subpart QQQQ), Section 60.5476(e). You are requesting an alternative certification procedure to use the Canadian Standards Association (CSA) B415.1-10 test method, "Performance testing of solid-fuel-burning heating appliances," including thermostatically controlled warm air furnaces using cordwood as stated in section 7.2 of the CSA standard in lieu of the Method 28 WHH (40 CFR 60, Appendix A) procedures required by Subpart QQQQ.

In your correspondence, you are requesting the alternative certification testing procedure for your furnace because it is thermostatically-controlled and there is the potential for extreme BTU delivery to cause longer ramp down to the lowest BTU delivered. You also note, that when operating at the lowest rate preset by factory with normal operating mode for the blower, the furnace will produce more delivered BTU output than allowed for the Category 1 burn in EPA Method 28 WHH. In addition, you state that the furnace can not maintain combustion under the required Method 28 test procedure and it will force the fire to go out.

To address these issues, you are requesting to use the burn rate categories of CSA Method B415.1-10 in Section 7.2.1.2 in lieu of those in Method 28 WHH with the following modifications:

- Category IV - Operate at maximum capacity with forced combustion inducer engaged during the entire test.
- Category III - Operate with the switch for inducer "on" and "off" to meet specific output range.
- Category II - Operate with the switch for inducer "on" and "off" to meet specific output range.

- Category I - Operate at the lowest heat output below 35% of the maximum output of the furnace.

With the caveats set forth below, we are approving your alternative method request for certification testing of the AirBilo PLUS brand thermostatically-controlled forced air furnace. As required in Subpart QQQQ, Section 60.5476(c)(6), the manufacturer or approved test lab must also measure the first hour of particulate matter emissions for each test run using a separate filter in one of the two parallel sampling trains. These results must be reported separately and also included in the total particulate matter emissions per run. Also, as required in Subpart QQQQ, Section 60.5476(a), the manufacturer must have the approved test laboratory measure the efficiency, heat output, and carbon monoxide emissions of the tested wood heater using CSA Method B415.1-10. For particulate matter emission concentrations, ASTM E2515-11 "Standard Test Method for Determination of Particulate Matter Emissions Collected by a Dilution Tunnel" must be used; four inch filters are acceptable. Disregard Sections 8.3.1 and 8.4 in CSA Method B415.1-10 regarding the use of Douglas fir lumber in a crib wood configuration for EPA testing. However, for cordwood, you may use Douglas fir as well as any of the other species of wood listed in CSA Method B415.1-10.

The AirBilo PLUS brand forced-air furnace design incorporates a low setting on its controller which is the lowest heat output (Btu/hr) setting available to the user and corresponds to the lowest burn rate to be evaluated during certification testing; this is consistent with 40 CFR part 60, Subpart QQQQ, section 60.5476, which states "*The burn rate for the low burn category must be no greater than the rate that an operator can achieve in home use and no greater than is advertised by the manufacturer or retailer.*"

It is reasonable that this alternative test method approval be broadly applicable to certification testing of forced air furnaces subject to the requirements of 40 CFR part 60, Subpart QQQQ. For this reason, we will post this letter as ALT-134 on our website at <http://www3.epa.gov/ttn/emc/approalt.html> for use by other interested parties. A copy of this letter must be included in each certification test report. The emission limit in the rule remains intact and time weighted averaging is not allowed. This alternative method approval is valid until such time that Subpart QQQQ is revised or replaced to require a different certification method for these units, and at such time, this alternative will be reconsidered and possibly withdrawn.

When doing the certification testing of the AirBilo PLUS, the burn rate requirements in Section 7.2.1.2 of CSA Method B415.1-10 must be followed:

1. Category 1: Operate at the lowest delivered output that the unit is able to operate at (idle mode with no heat demand from the home/thermostat), and be below 35% of the Maximum of the heat output of the furnace.
2. Category 2: Heat output shall be between 35 and 53% of the maximum heat output of furnace.
3. Category 3: Heat output shall be between 53 and 76% of the maximum heat output of furnace.

4. Category 4: Heat output shall be the maximum heat output of the furnace.

The procedures in Section 7.2.2.2 of CSA Method B415.1-10 must be followed completely regarding Category 1 through 3 heat output using the remote control switch in the on position at the beginning of the test and leaving it on until the heat output for these categories are met, at which point the on switch can be turned off, and turned back on when the average heat demand drops below the determined target percentage of maximum heat output, at this point the switch can be in the on position to meet the heat output category being tested. Allow the heat output to fall below the target rate, then switch on the heat demand, and switch that off once target is reached. This cycle should be repeated for the entire test.

The following changes to ASTM E2515-11 must be followed for the certification testing:

1. Filters must be weighed in pairs to reduce weighing error propagation. See ASTM E2515-11, section 10.2.1, Analytical Procedure.
2. Sample filters must be Pall TX-40 or equivalent Teflon-coated glass fiber filters, and 47 mm, 90 mm, 100 mm, or 110 mm in diameter.
3. Only one point is allowed outside the +/- 10 percent proportionality range per test run.
